Normalization by Evaluation

Klaus Aehlig and Tobias Nipkow

February 6, 2026

Abstract

This article formalizes normalization by evaluation as implemented in Isabelle. Lambda calculus plus term rewriting is compiled into a functional program with pattern matching. It is proved that the result of a successful evaluation is a) correct, i.e. equivalent to the input, and b) in normal form.

An earlier version of this theory is described in a paper by Aehlig *et al.* [1]. The normal form proof is not in that paper.

1 Terms

type-synonym *vname* = *nat*
type-synonym *ml-vname* = *nat*

type-synonym *cname* = *int*

ML terms:

datatype *ml* =
— ML
C-ML cname (‹C_{ML}›)
| *V-ML ml-vname* (‹V_{ML}›)
| *A-ML ml* (*ml list*) (‹A_{ML}›)
| *Lam-ML ml* (‹Lam_{ML}›)
— the universal datatype
| C_U *cname* (*ml list*)
| V_U *vname* (*ml list*)
| *Clo ml* (*ml list*) *nat*
— ML function *apply*
| *apply ml ml*

Lambda-terms:

datatype *tm* = *C cname* | *V vname* | Λ *tm* | *At tm tm* (**infix** ‹·› *100*)
| *term ml* — ML function `term`

The following locale captures type conventions for variables. It is not actually used, merely a formal comment.

locale *Vars* =
fixes *r s t*:: *tm*
and *rs ss ts* :: *tm list*
and *u v w* :: *ml*
and *us vs ws* :: *ml list*
and *nm* :: *cname*
and *x* :: *vname*
and *X* :: *ml-vname*

The subset of pure terms:

inductive *pure* :: *tm* ⇒ *bool* **where**
pure(*C nm*) |
pure(*V x*) |
Lam: *pure t* ⟹ *pure*(Λ *t*) |
pure s ⟹ *pure t* ⟹ *pure*(*s*•*t*)

declare *pure.intros*[*simp*]
declare *Lam*[*simp del*]

lemma *pure-Lam*[*simp*]: *pure*(Λ *t*) = *pure t*
⟨*proof*⟩

Closed terms w.r.t. ML variables:

fun *closed-ML* :: *nat* ⇒ *ml* ⇒ *bool* (‹$closed_{ML}$›) **where**
$closed_{ML}$ *i* (C_{ML} *nm*) = *True* |
$closed_{ML}$ *i* (V_{ML} *X*) = (*X*<*i*) |
$closed_{ML}$ *i* (A_{ML} *v vs*) = ($closed_{ML}$ *i v* ∧ (∀ *v* ∈ *set vs*. $closed_{ML}$ *i v*)) |
$closed_{ML}$ *i* (Lam_{ML} *v*) = $closed_{ML}$ (*i*+*1*) *v* |
$closed_{ML}$ *i* (C_U *nm vs*) = (∀ *v* ∈ *set vs*. $closed_{ML}$ *i v*) |
$closed_{ML}$ *i* (V_U *nm vs*) = (∀ *v* ∈ *set vs*. $closed_{ML}$ *i v*) |
$closed_{ML}$ *i* (*Clo f vs n*) = ($closed_{ML}$ *i f* ∧ (∀ *v* ∈ *set vs*. $closed_{ML}$ *i v*)) |
$closed_{ML}$ *i* (*apply v w*) = ($closed_{ML}$ *i v* ∧ $closed_{ML}$ *i w*)

fun *closed-tm-ML* :: *nat* ⇒ *tm* ⇒ *bool* (‹$closed_{ML}$›) **where**
closed-tm-ML i (*r*•*s*) = (*closed-tm-ML i r* ∧ *closed-tm-ML i s*) |
closed-tm-ML i (Λ *t*) = (*closed-tm-ML i t*) |
closed-tm-ML i (*term v*) = *closed-ML i v* |
closed-tm-ML i v = *True*

Free variables:

fun *fv-ML* :: *ml* ⇒ *ml-vname set* (‹fv_{ML}›) **where**
fv_{ML} (C_{ML} *nm*) = {} |
fv_{ML} (V_{ML} *X*) = {*X*} |
fv_{ML} (A_{ML} *v vs*) = fv_{ML} *v* ∪ (⋃ *v* ∈ *set vs*. fv_{ML} *v*) |
fv_{ML} (Lam_{ML} *v*) = {*X*. *Suc X* : fv_{ML} *v*} |
fv_{ML} (C_U *nm vs*) = (⋃ *v* ∈ *set vs*. fv_{ML} *v*) |
fv_{ML} (V_U *nm vs*) = (⋃ *v* ∈ *set vs*. fv_{ML} *v*) |
fv_{ML} (*Clo f vs n*) = fv_{ML} *f* ∪ (⋃ *v* ∈ *set vs*. fv_{ML} *v*) |
fv_{ML} (*apply v w*) = fv_{ML} *v* ∪ fv_{ML} *w*

primrec *fv* :: *tm* ⇒ *vname set* **where**
fv (*C nm*) = {} |
fv (*V X*) = {*X*} |
fv (*s* · *t*) = *fv s* ∪ *fv t* |
fv (Λ *t*) = {*X*. *Suc X* : *fv t*}

1.1 Iterated Term Application

abbreviation *foldl-At* (**infix** ‹··› *90*) **where**
