

A Formalization of Pratt's Primality Certificates

By Simon Wimmer and Lars Noschinski

May 26, 2024

Abstract

In 1975, Pratt introduced a proof system for certifying primes [1]. He showed that a number p is prime iff a primality certificate for p exists. By showing a logarithmic upper bound on the length of the certificates in size of the prime number, he concluded that the decision problem for prime numbers is in NP. This work formalizes soundness and completeness of Pratt's proof system as well as an upper bound for the size of the certificate.

1 Pratt's Primality Certificates

```
theory Pratt-Certificate
imports
  Complex-Main
  Lehmer.Lehmer
begin
```

This work formalizes Pratt's proof system as described in his article “Every Prime has a Succinct Certificate”[1].

The proof system makes use of two types of predicates:

- $\text{Prime}(p)$: p is a prime number
- (p, a, x) : $\forall q \in \text{prime-factors}(x). [a \widehat{\wedge} ((p - 1) \text{ div } q) \neq 1] \pmod{p}$

We represent these predicates with the following datatype:

```
datatype pratt = Prime nat | Triple nat nat nat
```

Pratt describes an inference system consisting of the axiom $(p, a, 1)$ and the following inference rules:

- R1: If we know that (p, a, x) and $[a \tilde{\wedge} ((p - 1) \text{ div } q) \neq 1] \pmod{p}$ hold for some prime number q we can conclude (p, a, qx) from that.
- R2: If we know that $(p, a, p - 1)$ and $[a \tilde{\wedge} (p - 1) = 1] \pmod{p}$ hold, we can infer $\text{Prime}(p)$.

Both rules follow from Lehmer's theorem as we will show later on.

A list of predicates (i.e., values of type *pratt*) is a *certificate*, if it is built according to the inference system described above. I.e., a list $x \# xs$ is a certificate if xs is a certificate and x is either an axiom or all preconditions of x occur in xs .

We call a certificate xs a *certificate for* p , if $\text{Prime } p$ occurs in xs .

The function *valid-cert* checks whether a list is a certificate.

```
fun valid-cert :: pratt list  $\Rightarrow$  bool where
  valid-cert [] = True
  | R2: valid-cert (Prime p#xs)  $\longleftrightarrow$  1 < p  $\wedge$  valid-cert xs
     $\wedge$  ( $\exists$  a .  $[a \tilde{\wedge} (p - 1) = 1] \pmod{p}$   $\wedge$  Triple p a (p - 1)  $\in$  set xs)
  | R1: valid-cert (Triple p a x # xs)  $\longleftrightarrow$  p > 1  $\wedge$  0 < x  $\wedge$  valid-cert xs  $\wedge$  (x=1  $\vee$ 
    ( $\exists$  q y. x = q * y  $\wedge$  Prime q  $\in$  set xs  $\wedge$  Triple p a y  $\in$  set xs
       $\wedge$   $[a \tilde{\wedge} ((p - 1) \text{ div } q) \neq 1] \pmod{p}$ ))
```

We define a function *size-cert* to measure the size of a certificate, assuming a binary encoding of numbers. We will use this to show that there is a certificate for a prime number p such that the size of the certificate is polynomially bounded in the size of the binary representation of p .

```
fun size-pratt :: pratt  $\Rightarrow$  real where
  size-pratt (Prime p) = log 2 p |
  size-pratt (Triple p a x) = log 2 p + log 2 a + log 2 x

fun size-cert :: pratt list  $\Rightarrow$  real where
  size-cert [] = 0 |
  size-cert (x # xs) = 1 + size-pratt x + size-cert xs
```

1.1 Soundness

In Section 1 we introduced the predicates $\text{Prime}(p)$ and (p, a, x) . In this section we show that for a certificate every predicate occurring in this certificate holds. In particular, if $\text{Prime}(p)$ occurs in a certificate, p is prime.

```
lemma prime-factors-one [simp]: shows prime-factors (Suc 0) = {}
```

shows $(t = \text{Prime } p \longrightarrow \text{prime } p) \wedge$
 $(t = \text{Triple } p a x \longrightarrow ((\forall q \in \text{prime-factors } x. [a \wedge ((p - 1) \text{ div } q) \neq 1] \pmod p) \wedge 0 < x))$
 $\langle proof \rangle$

corollary pratt-primeI:
assumes valid-cert xs Prime $p \in \text{set } xs$
shows prime p
 $\langle proof \rangle$

1.2 Completeness

In this section we show completeness of Pratt's proof system, i.e., we show that for every prime number p there exists a certificate for p . We also give an upper bound for the size of a minimal certificate.

The prove we give is constructive. We assume that we have certificates for all prime factors of $p - 1$ and use these to build a certificate for p from that. It is important to note that certificates can be concatenated.

lemma valid-cert-appendI:
assumes valid-cert r
assumes valid-cert s

```

shows valid-cert (r @ s)
⟨proof⟩

lemma valid-cert-concatI: ( $\forall x \in \text{set } xs . \text{valid-cert } x \Rightarrow \text{valid-cert} (\text{concat } xs)$ )
⟨proof⟩

lemma size-pratt-le:
fixes d::real
assumes  $\forall x \in \text{set } c . \text{size-pratt } x \leq d$ 
shows size-cert c  $\leq \text{length } c * (1 + d)$  ⟨proof⟩

fun build-fpc :: nat  $\Rightarrow$  nat  $\Rightarrow$  nat  $\Rightarrow$  nat list  $\Rightarrow$  pratt list where
  build-fpc p a r [] = [Triple p a r] |
  build-fpc p a r (y # ys) = Triple p a r # build-fpc p a (r div y) ys

```

The function *build-fpc* helps us to construct a certificate for p from the certificates for the prime factors of $p - 1$. Called as *build-fpc* p a $(p - 1)$ qs where $qs = q_1 \dots q_n$ is prime decomposition of $p - 1$ such that $q_1 \dots q_n = p - 1$, it returns the following list of predicates:

$$(p, a, p - 1), (p, a, \frac{p - 1}{q_1}), (p, a, \frac{p - 1}{q_1 q_2}), \dots, (p, a, \frac{p - 1}{q_1 \dots q_n}) = (p, a, 1)$$

I.e., if there is an appropriate a and and a certificate rs for all prime factors of p , then we can construct a certificate for p as

Prime $p \# \text{build-fpc } p a (p - 1) qs @ rs$

The following lemma shows that *build-fpc* extends a certificate that satisfies the preconditions described before to a correct certificate.

```

lemma correct-fpc:
assumes valid-cert xs p > 1
assumes prod-list qs = r r ≠ 0
assumes  $\forall q \in \text{set } qs . \text{Prime } q \in \text{set } xs$ 
assumes  $\forall q \in \text{set } qs . [a \nmid ((p - 1) \text{ div } q) \neq 1] \pmod{p}$ 
shows valid-cert (build-fpc p a r qs @ xs)
⟨proof⟩

lemma length-fpc:
length (build-fpc p a r qs) = length qs + 1 ⟨proof⟩

lemma div-gt-0:
fixes m n :: nat assumes m ≤ n 0 < m shows 0 < n div m
⟨proof⟩

lemma size-pratt-fpc:
assumes a ≤ p r ≤ p 0 < a 0 < r 0 < p prod-list qs = r
shows  $\forall x \in \text{set } (\text{build-fpc } p a r qs) . \text{size-pratt } x \leq 3 * \log 2 p$  ⟨proof⟩

```

```

lemma concat-set:
  assumes  $\forall q \in qs . \exists c \in set cs . Prime q \in set c$ 
  shows  $\forall q \in qs . Prime q \in set (concat cs)$ 
   $\langle proof \rangle$ 

lemma p-in-prime-factorsE:
  fixes  $n :: nat$ 
  assumes  $p \in prime-factors n$   $0 < n$ 
  obtains  $2 \leq p$   $p \leq n$   $p \text{ dvd } n$   $prime p$ 
   $\langle proof \rangle$ 

lemma prime-factors-list-prime:
  fixes  $n :: nat$ 
  assumes  $prime n$ 
  shows  $\exists qs. prime-factors n = set qs \wedge prod-list qs = n \wedge length qs = 1$ 
   $\langle proof \rangle$ 

lemma prime-factors-list:
  fixes  $n :: nat$  assumes  $3 < n \neg prime n$ 
  shows  $\exists qs. prime-factors n = set qs \wedge prod-list qs = n \wedge length qs \geq 2$ 
   $\langle proof \rangle$ 

lemma prod-list-ge:
  fixes  $xs :: nat list$ 
  assumes  $\forall x \in set xs . x \geq 1$ 
  shows  $prod-list xs \geq 1$   $\langle proof \rangle$ 

lemma sum-list-log:
  fixes  $b :: real$ 
  fixes  $xs :: nat list$ 
  assumes  $b : b > 0$   $b \neq 1$ 
  assumes  $xs : \forall x \in set xs . x \geq b$ 
  shows  $(\sum x \leftarrow xs. \log b x) = \log b (prod-list xs)$ 
   $\langle proof \rangle$ 

lemma concat-length-le:
  fixes  $g :: nat \Rightarrow real$ 
  assumes  $\forall x \in set xs . real (length (f x)) \leq g x$ 
  shows  $length (concat (map f xs)) \leq (\sum x \leftarrow xs. g x)$   $\langle proof \rangle$ 

lemma prime-gt-3-impl-p-minus-one-not-prime:
  fixes  $p :: nat$ 
  assumes  $prime p$   $p > 3$ 
  shows  $\neg prime (p - 1)$ 
   $\langle proof \rangle$ 

```

We now prove that Pratt's proof system is complete and derive upper bounds for the length and the size of the entries of a minimal certificate.

```

theorem pratt-complete':
  assumes prime p
  shows  $\exists c. \text{Prime } p \in \text{set } c \wedge \text{valid-cert } c \wedge \text{length } c \leq 6 * \log 2 p - 4 \wedge (\forall x \in \text{set } c. \text{size-pratt } x \leq 3 * \log 2 p)$   $\langle \text{proof} \rangle$ 

```

We now recapitulate our results. A number p is prime if and only if there is a certificate for p . Moreover, for a prime p there always is a certificate whose size is polynomially bounded in the logarithm of p .

```

corollary pratt:
  prime p  $\longleftrightarrow$  ( $\exists c. \text{Prime } p \in \text{set } c \wedge \text{valid-cert } c$ )
   $\langle \text{proof} \rangle$ 

```

```

corollary pratt-size:
  assumes prime p
  shows  $\exists c. \text{Prime } p \in \text{set } c \wedge \text{valid-cert } c \wedge \text{size-cert } c \leq (6 * \log 2 p - 4) * (1 + 3 * \log 2 p)$   $\langle \text{proof} \rangle$ 

```

1.3 Efficient modular exponentiation

```

locale efficient-power =

$\langle ML \rangle$

The proof method replays a given Pratt certificate to prove the primality of a given number. If no certificate is given, the method attempts to compute one. The computed certificate is then also printed with a prompt to insert it into the proof document so that it does not have to be recomputed the next time.

The format of the certificates is compatible with those generated by Mathematica. Therefore, for larger numbers, certificates generated by Mathematica can be used with this method directly.
