Separata: Isabelle tactics for Separation Algebra

By Zhé Hóu, David Sanán, Alwen Tiu, Rajeev Goré, Ranald Clouston

February 6, 2026

Abstract

We bring the labelled sequent calculus LS_{PASL} for propositional abstract separation logic to Isabelle. The tactics given here are directly applied on an extension of the separation algebra in the AFP. In addition to the cancellative separation algebra, we further consider some useful properties in the heap model of separation logic, such as indivisible unit, disjointness, and cross-split. The tactics are essentially a proof search procedure for the calculus LS_{PASL}. We wrap the tactics in an Isabelle method called separata, and give a few examples of separation logic formulae which are provable by separata.

begin

The tactics in this file are a simple proof search procedure based on the labelled sequent calculus LS_PASL for Propositional Abstract Separation Logic in Zhe's PhD thesis.

We define a class which is an extension to cancellative_sep_algebra with other useful properties in separation algebra, including: indivisible unit, disjointness, and cross-split. We also add a property about the (reverse) distributivity of the disjointness.

class *heap-sep-algebra* = *cancellative-sep-algebra* +

assumes *sep-add-ind-unit*: $[\![x + y = 0; x \#\# y]\!] \Longrightarrow x = 0$
assumes *sep-add-disj*: $x\#\#x \Longrightarrow x = 0$
assumes *sep-add-cross-split*:
$[\![a + b = w; c + d = w; a \#\# b; c \#\# d]\!] \Longrightarrow$
$\exists\ e\ f\ g\ h.\ e + f = a \wedge g + h = b \wedge e + g = c \wedge f + h = d \wedge$
$e \#\# f \wedge g \#\# h \wedge e \#\# g \wedge f \#\# h$
assumes *disj-dstri*: $[\![x \#\# y; y \#\# z; x \#\# z]\!] \Longrightarrow x \#\# (y + z)$
begin

1 Lemmas about the labelled sequent calculus.

An abbreviation of the + and ## operators in Separation_Algebra.thy. This notion is closer to the ternary relational atoms used in the literature. This will be the main data structure which our labelled sequent calculus works on.

definition *tern-rel*:: $'a \Rightarrow 'a \Rightarrow 'a \Rightarrow bool$ $(\langle(\text{-},\text{-}\triangleright\text{-})\rangle\ 25)$ **where**
$tern\text{-}rel\ a\ b\ c \equiv a \#\# b \wedge a + b = c$

lemma *exist-comb*: $x \#\# y \Longrightarrow \exists z.\ (x,y\triangleright z)$
⟨*proof*⟩

lemma *disj-comb*:
assumes *a1*: $(x,y\triangleright z)$
assumes *a2*: $x \#\# w$
assumes *a3*: $y \#\# w$
shows $z \#\# w$
⟨*proof*⟩

The following lemmas corresponds to inference rules in LS_PASL. Thus these lemmas prove the soundness of LS_PASL. We also show the invertibility of those rules.

lemma (**in** −) *lspasl-id*:
$Gamma \wedge (A\ h) \Longrightarrow (A\ h) \vee Delta$
⟨*proof*⟩

lemma (**in** −) *lspasl-botl*:
$Gamma \wedge (sep\text{-}false\ h) \Longrightarrow Delta$
⟨*proof*⟩

lemma (**in** −) *lspasl-topr*:
$gamma \Longrightarrow (sep\text{-}true\ h) \vee Delta$
⟨*proof*⟩

lemma *lspasl-empl*:
$Gamma \wedge (h = 0) \longrightarrow Delta \Longrightarrow$
$Gamma \wedge (sep\text{-}empty\ h) \longrightarrow Delta$
⟨*proof*⟩

lemma *lspasl-empl-inv*:
$Gamma \wedge (sep\text{-}empty\ h) \longrightarrow Delta \Longrightarrow$
$Gamma \wedge (h = 0) \longrightarrow Delta$
⟨*proof*⟩

The following two lemmas are the same as applying simp add: sep_empty_def.

lemma *lspasl-empl-der*: $sep\text{-}empty\ h \Longrightarrow h = 0$
⟨*proof*⟩

lemma *lspasl-empl-eq*: $(sep\text{-}empty\ h) = (h = 0)$
⟨*proof*⟩

lemma *lspasl-empr*:
$Gamma \longrightarrow (sep\text{-}empty\ 0) \vee Delta$
⟨*proof*⟩

end

lemma *lspasl-notl*:
$Gamma \longrightarrow (A\ h) \vee Delta \Longrightarrow$
$Gamma \wedge ((not\ A)\ h) \longrightarrow Delta$
⟨*proof*⟩

lemma *lspasl-notl-inv*:
$Gamma \wedge ((not\ A)\ h) \longrightarrow Delta \Longrightarrow$
$Gamma \longrightarrow (A\ h) \vee Delta$
⟨*proof*⟩

lemma *lspasl-notr*:
$Gamma \wedge (A\ h) \longrightarrow Delta \Longrightarrow$
$Gamma \longrightarrow ((not\ A)\ h) \vee Delta$
⟨*proof*⟩

lemma *lspasl-notr-inv*:
$Gamma \longrightarrow ((not\ A)\ h) \vee Delta \Longrightarrow$
$Gamma \wedge (A\ h) \longrightarrow Delta$
⟨*proof*⟩

lemma *lspasl-andl*:
$Gamma \wedge (A\ h) \wedge (B\ h) \longrightarrow Delta \Longrightarrow$
$Gamma \wedge ((A\ and\ B)\ h) \longrightarrow Delta$
⟨*proof*⟩

lemma *lspasl-andl-inv*:
$Gamma \wedge ((A\ and\ B)\ h) \longrightarrow Delta \Longrightarrow$
$Gamma \wedge (A\ h) \wedge (B\ h) \longrightarrow Delta$
⟨*proof*⟩

lemma *lspasl-andr*:
$[\![Gamma \longrightarrow (A\ h) \vee Delta;\ Gamma \longrightarrow (B\ h) \vee Delta]\!] \Longrightarrow$
$Gamma \longrightarrow ((A\ and\ B)\ h) \vee Delta$
⟨*proof*⟩

lemma *lspasl-andr-inv*:
$Gamma \longrightarrow ((A\ and\ B)\ h) \vee Delta \Longrightarrow$
$(Gamma \longrightarrow (A\ h) \vee Delta) \wedge (Gamma \longrightarrow (B\ h) \vee Delta)$
⟨*proof*⟩

lemma *lspasl-orl*:
$[\![Gamma \wedge (A\ h) \longrightarrow Delta;\ Gamma \wedge (B\ h) \longrightarrow Delta]\!] \Longrightarrow$
$Gamma \wedge (A\ or\ B)\ h \longrightarrow Delta$
⟨*proof*⟩

lemma *lspasl-orl-inv*:
$Gamma \wedge (A\ or\ B)\ h \longrightarrow Delta \Longrightarrow$
$(Gamma \wedge (A\ h) \longrightarrow Delta) \wedge (Gamma \wedge (B\ h) \longrightarrow Delta)$
⟨*proof*⟩

lemma *lspasl-orr*:
$Gamma \longrightarrow (A\ h) \vee (B\ h) \vee Delta \Longrightarrow$
$Gamma \longrightarrow ((A\ or\ B)\ h) \vee Delta$
⟨*proof*⟩

lemma *lspasl-orr-inv*:
$Gamma \longrightarrow ((A\ or\ B)\ h) \vee Delta \Longrightarrow$
$Gamma \longrightarrow (A\ h) \vee (B\ h) \vee Delta$
⟨*proof*⟩

lemma *lspasl-impl*:
$[\![Gamma \longrightarrow (A\ h) \vee Delta;\ Gamma \wedge (B\ h) \longrightarrow Delta]\!] \Longrightarrow$
$Gamma \wedge ((A\ imp\ B)\ h) \longrightarrow Delta$
⟨*proof*⟩

lemma *lspasl-impl-inv*:
$Gamma \wedge ((A\ imp\ B)\ h) \longrightarrow Delta \Longrightarrow$
$(Gamma \longrightarrow (A\ h) \vee Delta) \wedge (Gamma \wedge (B\ h) \longrightarrow Delta)$
⟨*proof*⟩

lemma *lspasl-impr*:
$Gamma \wedge (A\ h) \longrightarrow (B\ h) \vee Delta \Longrightarrow$
$Gamma \longrightarrow ((A\ imp\ B)\ h) \vee Delta$
⟨*proof*⟩

lemma *lspasl-impr-inv*:
$Gamma \longrightarrow ((A\ imp\ B)\ h) \vee Delta \Longrightarrow$
$Gamma \wedge (A\ h) \longrightarrow (B\ h) \vee Delta$
⟨*proof*⟩

context *heap-sep-algebra*
begin

We don't provide lemmas for derivations for the classical connectives, as Isabelle proof methods can easily deal with them.

lemma *lspasl-starl*:
$(\exists\, h1\ h2.\ (Gamma \wedge (h1{,}h2 \triangleright h0) \wedge (A\ h1) \wedge (B\ h2))) \longrightarrow Delta \Longrightarrow$
$Gamma \wedge ((A \ast\ast B)\ h0) \longrightarrow Delta$
⟨*proof*⟩

lemma *lspasl-starl-inv*:
$Gamma \wedge ((A \ast\ast B)\ h0) \longrightarrow Delta \Longrightarrow$
$(\exists\, h1\ h2.\ (Gamma \wedge (h1{,}h2 \triangleright h0) \wedge (A\ h1) \wedge (B\ h2))) \longrightarrow Delta$
⟨*proof*⟩

lemma *lspasl-starl-der*:
$((A \ast\ast B)\ h0) \Longrightarrow (\exists\, h1\ h2.\ (h1{,}h2 \triangleright h0) \wedge (A\ h1) \wedge (B\ h2))$
⟨*proof*⟩

lemma *lspasl-starl-eq*:
$((A \ast\ast B)\ h0) = (\exists\, h1\ h2.\ (h1{,}h2 \triangleright h0) \wedge (A\ h1) \wedge (B\ h2))$
⟨*proof*⟩

lemma *lspasl-starr*:
$[\![Gamma \wedge (h1{,}h2 \triangleright h0) \longrightarrow (A\ h1) \vee ((A \ast\ast B)\ h0) \vee Delta;$
$Gamma \wedge (h1{,}h2 \triangleright h0) \longrightarrow (B\ h2) \vee ((A \ast\ast B)\ h0) \vee Delta]\!] \Longrightarrow$
$Gamma \wedge (h1{,}h2 \triangleright h0) \longrightarrow ((A \ast\ast B)\ h0) \vee Delta$
⟨*proof*⟩

lemma *lspasl-starr-inv*:
$Gamma \wedge (h1{,}h2 \triangleright h0) \longrightarrow ((A \ast\ast B)\ h0) \vee Delta \Longrightarrow$
$(Gamma \wedge (h1{,}h2 \triangleright h0) \longrightarrow (A\ h1) \vee ((A \ast\ast B)\ h0) \vee Delta) \wedge$
$(Gamma \wedge (h1{,}h2 \triangleright h0) \longrightarrow (B\ h2) \vee ((A \ast\ast B)\ h0) \vee Delta)$
⟨*proof*⟩

For efficiency we only apply *R on a pair of a ternary relational atom and a formula ONCE. To achieve this, we create a special predicate to indicate that a pair of a ternary relational atom and a formula has already been used in a *R application. Note that the predicate is true even if the *R rule hasn't been applied. We will not infer the truth of this predicate in proof search, but only check its syntactical appearance, which is only generated by the lemma lspasl_starr_der. We need to ensure that this predicate is not generated elsewhere in the proof search.

definition *starr-applied*:: $'a \Rightarrow 'a \Rightarrow 'a \Rightarrow ('a \Rightarrow bool) \Rightarrow bool$ **where**
$starr\text{-}applied\ h1\ h2\ h0\ F \equiv (h1{,}h2 \triangleright h0) \wedge \neg(F\ h0)$

lemma *lspasl-starr-der*:

$(h1,h2 \triangleright h0) \Longrightarrow \neg\ ((A \mathbin{**} B)\ h0) \Longrightarrow$
$((h1,h2 \triangleright h0) \wedge \neg\ ((A\ h1) \vee ((A \mathbin{**} B)\ h0)) \wedge (\textit{starr-applied h1 h2 h0}\ (A \mathbin{**} B)))$
$\vee$
$((h1,h2 \triangleright h0) \wedge \neg\ ((B\ h2) \vee ((A \mathbin{**} B)\ h0)) \wedge (\textit{starr-applied h1 h2 h0}\ (A \mathbin{**} B)))$
⟨*proof*⟩

In case the conclusion is not False, we normalise the goal as below.

method *norm-goal* = (
match **conclusion in** *False* ⇒ ‹*fail*›
|- ⇒ ‹*rule ccontr*›,
simp?
)

The tactic for separata. We first try to simplify the problem with auto simp add: sep_conj_ac, which ought to solve many problems. Then we apply the "true" invertible rules and structural rules which unify worlds as much as possible, followed by auto to simplify the goals. Then we apply *R and -*L and other structural rules. The rule CS is only applied when nothing else is applicable. We try not to use it.

***** Note, (try_lspasl_u |try_lspasl_e) |try_lspasl_a)+ may cause infinite loops. *****

method *separata* =
((*auto simp add*: *sep-conj-ac*)

```

4 Some examples.

Let's prove something that abstract separation logic provers struggle to prove. This can be proved easily in Isabelle, proof found by Sledgehammer.

lemma *fm-hard*: ((*sep-empty imp* (*p0* ⟶∗ (((*p0* ∗∗ (*p0* ⟶∗ *p1*)) ∗∗ (*not p1*)) ⟶∗
(*p0* ∗∗ (*p0* ∗∗ ((*p0* ⟶∗ *p1*) ∗∗ (*not p1*)))))))) *imp* ((((*sep-empty* ∗∗ *p0*) ∗∗
(*p0* ∗∗ ((*p0* ⟶∗ *p1*) ∗∗ (*not p1*)))) *imp* (((*p0* ∗∗ *p0*) ∗∗ (*p0* ⟶∗ *p1*)) ∗∗
(*not p1*))) ∗∗ *sep-empty*)) *h*
⟨*proof*⟩

The following formula can only be proved in partial-deterministic separation algebras. Sledgehammer took a rather long time to find a proof.

lemma *fm-partial*: (((*not* (*sep-true* ⟶∗ (*not sep-empty*))) ∗∗
(*not* (*sep-true* ⟶∗ (*not sep-empty*)))) *imp*
(*not* (*sep-true* ⟶∗ (*not sep-empty*))))
(*h*::*'a*::*heap-sep-algebra*)
⟨*proof*⟩

The following is the axiom of indivisible unit. Sledgehammer finds a proof easily.

lemma *ax-iu*: ((*sep-empty and* (*A* ∗∗ *B*)) *imp A*)
(*h*::*'a*::*heap-sep-algebra*)
⟨*proof*⟩

Sledgehammer fails to find a proof in 300s for this one.

lemma (*not* (((*A* ∗∗ (*C* ⟶∗ (*not* ((*not* (*A* ⟶∗ *B*)) ∗∗ *C*)))) *and* (*not B*)) ∗∗ *C*))
(*h*::*'a*::*heap-sep-algebra*)
⟨*proof*⟩

Sledgehammer finds a proof easily.

lemma ((*sep-empty* ⟶∗ (*not* ((*not A*) ∗∗ *sep-empty*))) *imp A*)

(*h*::*'a*::*heap-sep-algebra*)
⟨*proof*⟩

Sledgehammer finds a proof in 46 seconds.

lemma (*A imp* (*not* ((*not* (*A* ∗∗ *B*)) *and* (*not* (*A* ∗∗ (*not B*))))))
(*h*::*'a*::*heap-sep-algebra*)
⟨*proof*⟩

Sledgehammer easily finds a proof.

lemma ((*sep-empty and A*) *imp* (*A* ∗∗ *A*))
(*h*::*'a*::*heap-sep-algebra*)
⟨*proof*⟩

Sledgehammer fails to find a proof in 300s.

lemma (*not* (((*A* ∗∗ (*C* −→∗ (*not* ((*not* (*A* −→∗ *B*)) ∗∗ *C*)))) *and* (*not B*)) ∗∗ *C*))
